Original publisher: Iowa City, Iowa : The University of Iowa, Dept. of Physics and Astronomy ; Cleveland, Ohio : NASA Lewis Research Center, 1991 OCLC Number: (OCoLC)68622769 Excerpt: . . . represented as a ring-beam distribution to a first approximation. Using plasma parameters from various PDP instruments, a dispersion equation was derived for electrostatic waves in this magnetized plasma. It also appears in some cases that the contamination cloud can screen the orbiter from the usual motional $V \times B$ electric field by a system of currents associated with the contaminant ions. The currents are driven by the motional electric field which displaces the ions created in charge exchange reactions with the ambient O ions. The pick-up current, which screens the motional field is closed by field-aligned currents which are carried by a propagating Alfvén wave. 3. 5 Electron Beam Studies During the time that the PDP was a free-flying satellite on Spacelab 2, the electron generator (FPEG) was used to produce a 1-keV electron beam. The primary electron beam was not observed because the orbiter could not attain the accuracy necessary to put the...
